- Matching Law

- Remarks and Motive

- Matching Task in Monkeys

- Matching Behavior

- Spiking Network Model

- Reward Gated Plasticity

- Simulation Results

- Conclusion

The animal allocates its time between competing *choices* in a manner that it matches the relative *return* from those choices.

$$\frac{C_i}{C_1 + C_2 + \dots + C_n} = \frac{R_i}{R_1 + R_2 + \dots + R_n}$$

$$\text{return} = (\text{reward magnitude}) \times (\text{rate})$$

Herrnstein R.J., "The Matching Law, Papers in Psychology and Economics"

A decision-making network with winner-takes-all property.

Network Behavior

- Outline

- Adaptive Decision Making

- Spiking Network Model

- Network Behavior

- Stochastic Response

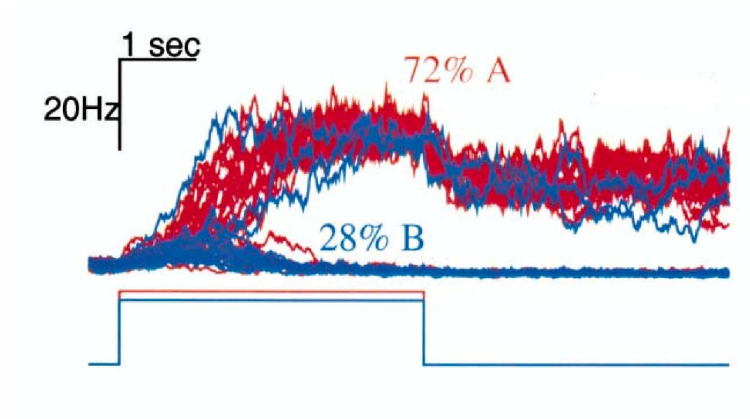

- Reward Gated Plasticity

- Simulation Results

- Conclusion

The network choice is determined by:

1. Strength of the inputs
2. Intrinsic noise in the neurons spiking

Wang X.J., Neuron 2002

Stochastic Response

- Outline

- Adaptive Decision Making

- Spiking Network Model

- Network Behavior

- Stochastic Response

- Reward Gated Plasticity

- Simulation Results

- Conclusion

The stochastic network behavior as a function of synaptic strengths is approximately sigmoidal.

$$\Pi = \frac{1}{1 + \exp\left(-\frac{p_A - p_B}{\sigma}\right)}$$

p_A : Probability of afferent synapses to population A being in potentiated state.

σ : Sensitivity of the network to the biased inputs
